## Assignment: Preparing the Development Environment

Initially, I tried using the virtual desktop, but found it performed very slowly, and I did not enjoy using it. I switched to my personal desktop and downloaded visual studio and found the program ran much faster this time around. When I first tried to run the code, I received an error:

“Impossible to open... Are you in the right directory? Don’t forget to read the FAQ!”, followed

by a blank image. I realized I was running MainCode.cpp instead of the solution. So, I opened the sample solution and attempted to run it again. I was able to successfully open the scene. As the camera was attached to my mouse, I was unable to see the controls that appeared on the command prompt without closing the scene entirely with the Esc button. How can I detach the camera from my mouse? The scene also appeared dark, but I'm not sure if that's how the scene is supposed to look. I had to set the snipping tool on a timer before quickly running the program to make sure the snipping tool opened after the image.
